

SVD - Definition

$$\mathbf{A}_{[m \times n]} = \mathbf{U}_{[m \times r]} \Sigma_{[r \times r]} (\mathbf{V}_{[n \times r]})^T$$

- **A: Input data matrix**
 - $m \times n$ matrix (e.g., m documents, n terms)
- **U: Left singular vectors**
 - $m \times r$ matrix (m documents, r concepts)
- **Σ : Singular values**
 - $r \times r$ diagonal matrix (strength of each 'concept')
(r : rank of the matrix **A**)
- **V: Right singular vectors**
 - $n \times \underline{r}$ matrix (n terms, r concepts)

Singular Value Decomposition

$$A \approx U \Sigma V^T = \sum_i \sigma_i \mathbf{u}_i \circ \mathbf{v}_i^T$$

SVD

$$\mathbf{A} \approx \mathbf{U}\mathbf{\Sigma}\mathbf{V}^T = \sum_i \sigma_i \mathbf{u}_i \circ \mathbf{v}_i^T$$

σ_i ... scalar
 \mathbf{u}_i ... vector
 \mathbf{v}_i ... vector

SVD - Properties

It is **always** possible to decompose a real matrix \mathbf{A} into $\mathbf{A} = \mathbf{U} \mathbf{\Sigma} \mathbf{V}^T$, where

- $\mathbf{U}, \mathbf{\Sigma}, \mathbf{V}$: **unique**
- \mathbf{U}, \mathbf{V} : **column orthonormal**
 - $\mathbf{U}^T \mathbf{U} = \mathbf{I}; \mathbf{V}^T \mathbf{V} = \mathbf{I}$ (\mathbf{I} : identity matrix)
 - (Columns are orthogonal unit vectors)
- $\mathbf{\Sigma}$: **diagonal**
 - Entries (**singular values**) are **positive**, and sorted in decreasing order ($\sigma_1 \geq \sigma_2 \geq \dots \geq 0$)
